# Agenda

---

Integration Gateway

---

Implementing Delta Query Support in Gateway OData

---

Push Enablement in SAP Mobile Platform 3.0

---

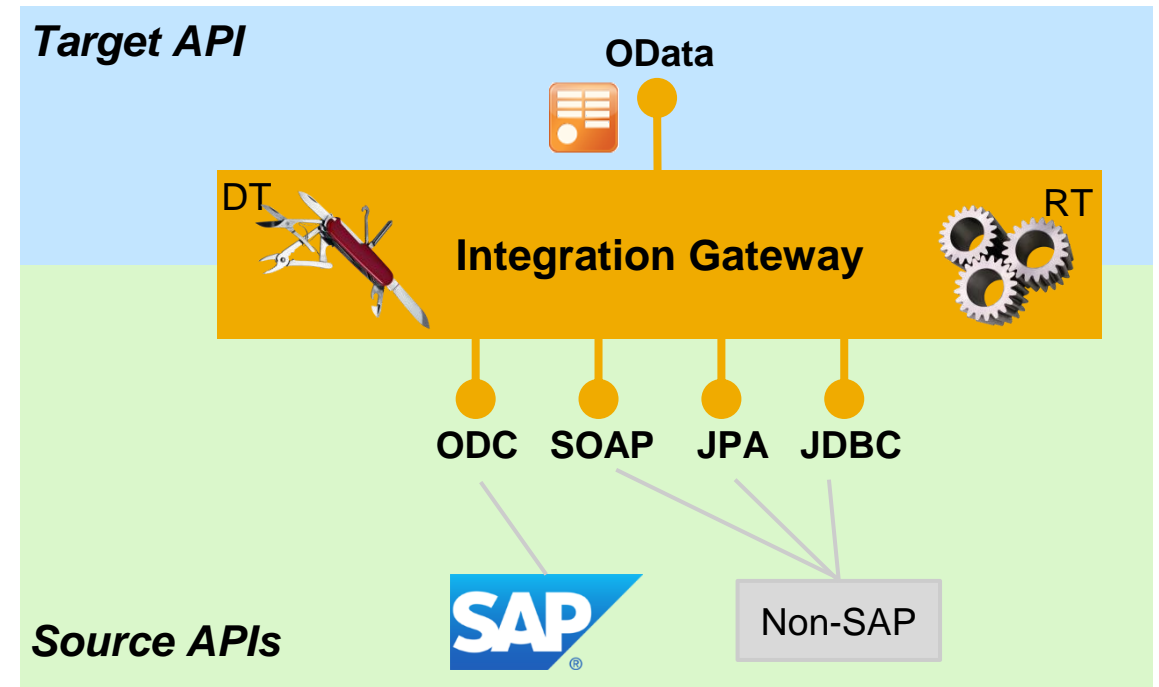

# Integration Gateway

# What is Integration Gateway?

**Integration Gateway** is a reusable technology component based on SAP Lean Java Server.

- **Seamless integration** of data from SAP and non-SAP systems.
- **Design-time tools** for modeling and defining new OData services based on different APIs and systems.
- **Runtime environment** for:
  - Running the provisioned OData services against the associated backend systems
  - Performing monitoring and other administrative tasks.

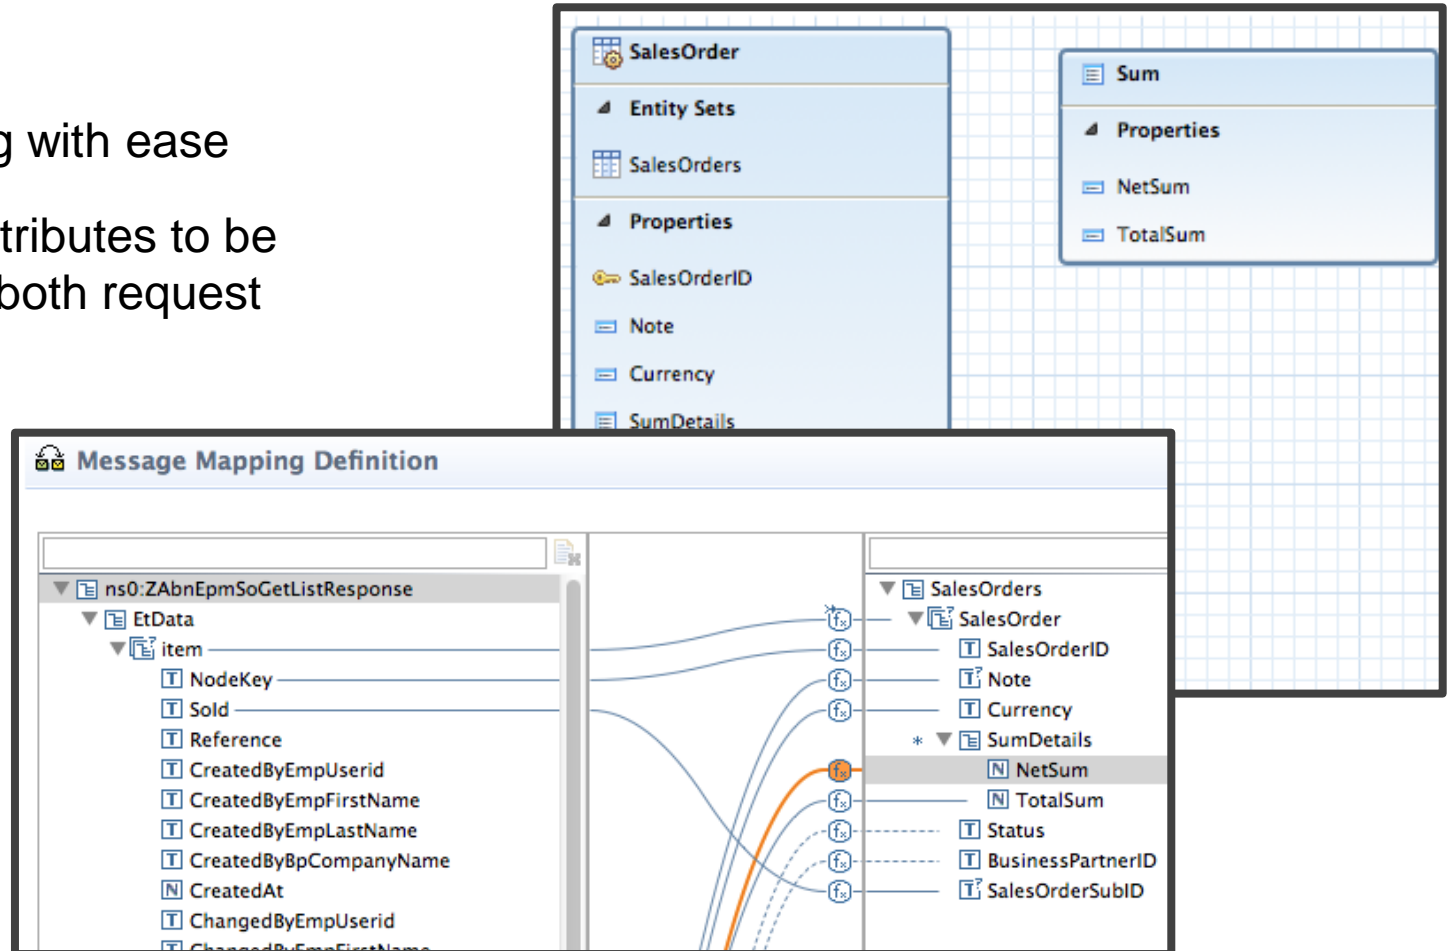

**Integration Gateway can be a part of SAP products on-premise or in the cloud**

# Integration Gateway – design-time tools

## Eclipse-based OData modeling and service implementation

- Interactive UI facilitates OData modeling with ease
- OData service implementation allows attributes to be mapped between source and target for both request and response messages.
- Deployment of OData service

# Integration Gateway – runtime tools

## Gateway Management Cockpit enables you to:

- Accessible at <https://<SMP Server>:<port>/gateway/cockpit>
- Configure backend destinations
- Register, activate, and deactivate OData services
- Assign destinations to provisioned services
- Access the OData service documents and the server log files

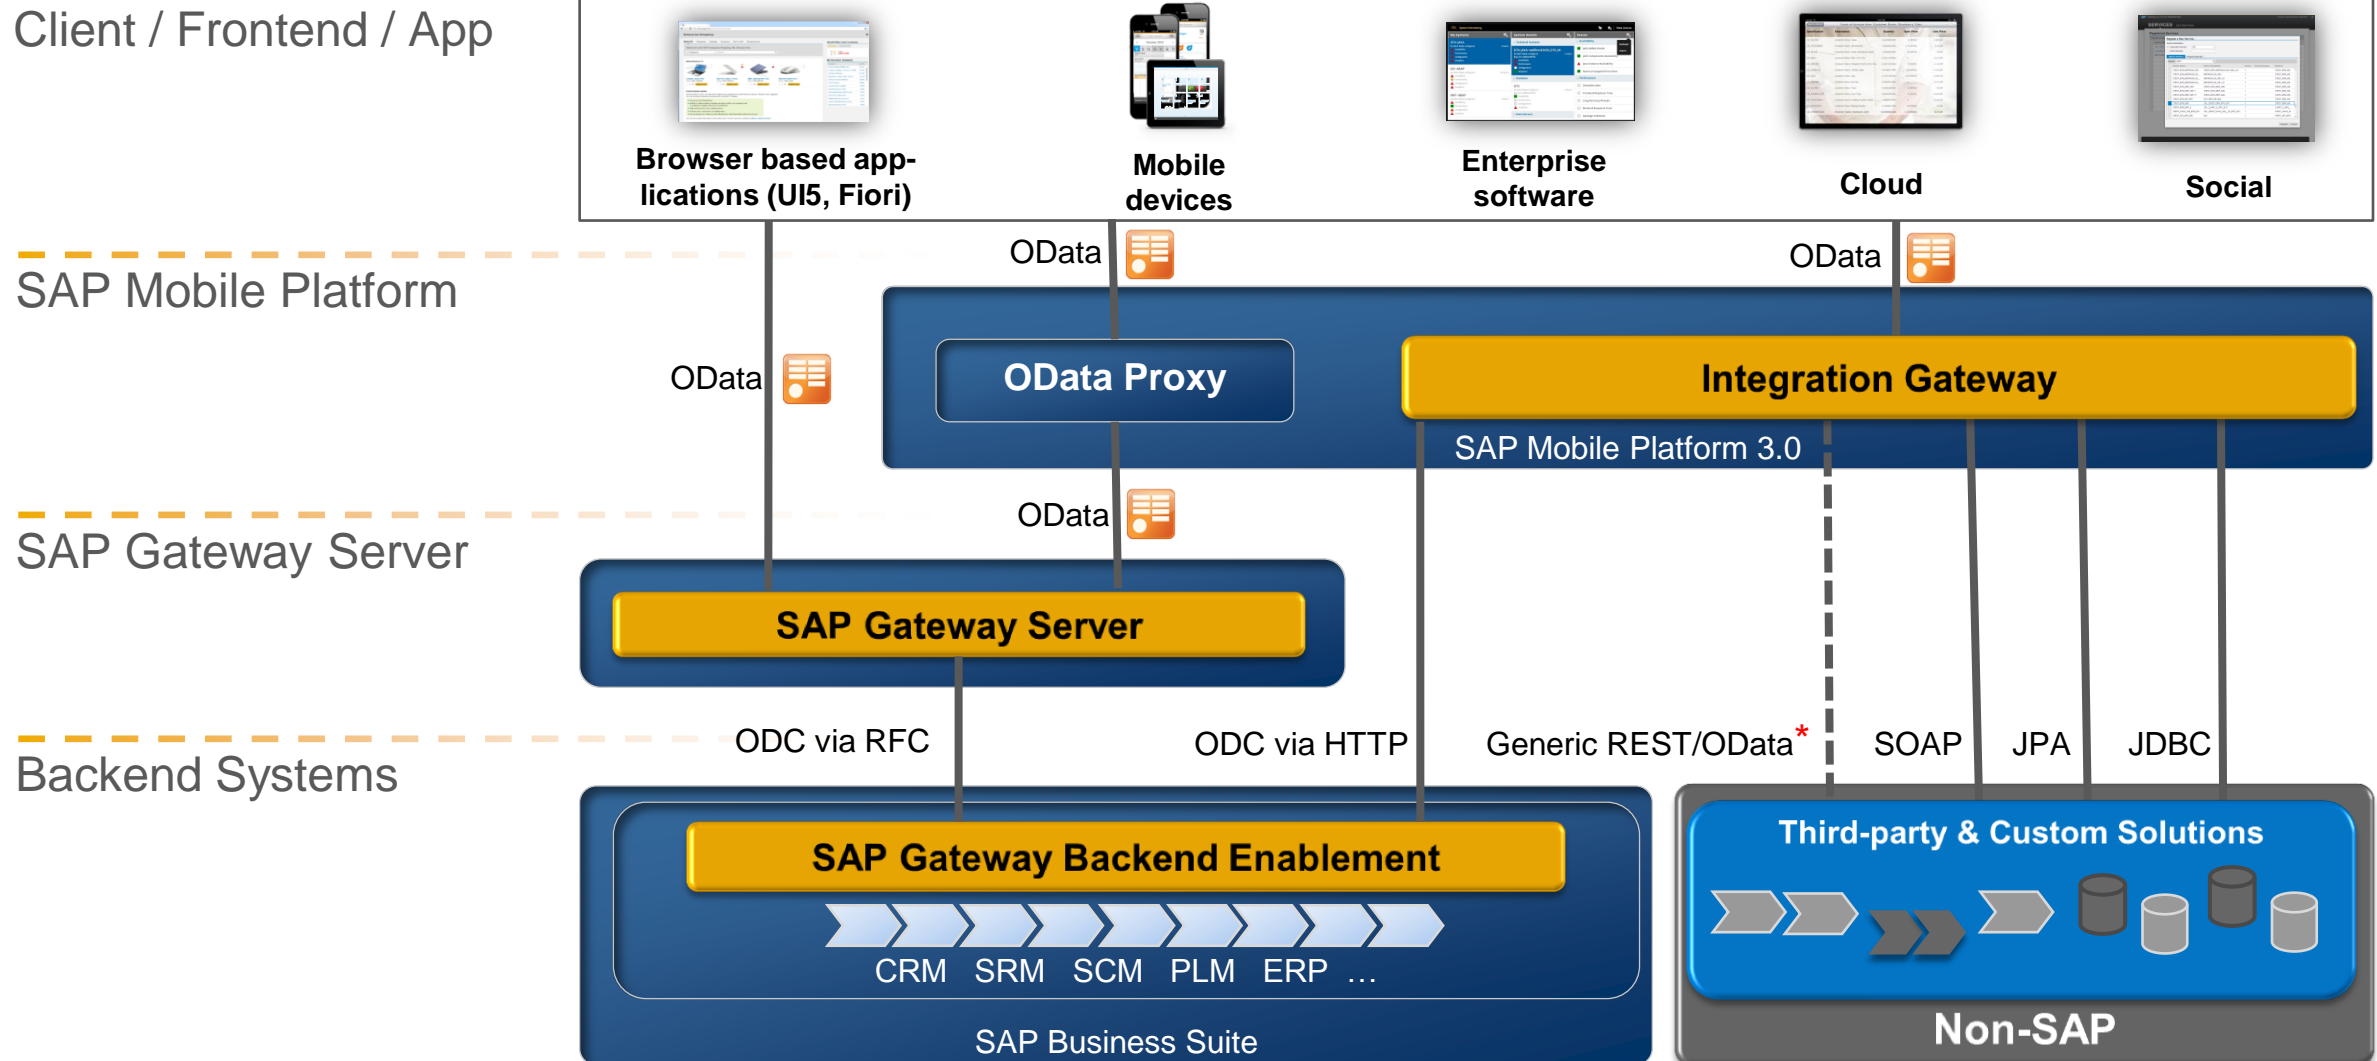

The image displays two screenshots of the SAP Gateway Management Cockpit interface. The top screenshot shows the 'SERVICES' tab, which includes a 'Registered Services' table with columns for Service Name, Namespace, Description, Version, Activation Status, and Default. The bottom screenshot shows the 'DESTINATIONS' tab, which includes a 'Destinations' table with columns for Destination Name, Destination Type, and Destination URL.

Service Name	Namespace	Description	Version	Activation Status	Default
BrandCalendarNew	sap	BrandCalendarNew	1	Inactive	
E2eDemo	sap	E2eDemo	1	Inactive	

Destination Name	Destination Type	Destination URL
ESPM	JPA	
GWN	HTTP	http://10.6
SMPDB	DATABASE	jdbc:derby

# SAP Gateway and Integration Gateway (in SMP 3.0)

# New Integration Gateway Features in SMP 3.0 SP04

## Design-time Enhancements

### Versioning (Target runtime)

- Show appropriate capabilities, migrate, error on wrong deployment

### UI Simplifications

- SOAP - WSDL parsing and value helps.
- Support for folders
- Improvements on wizards

### OData Designer simplifications

- Copy & Paste

### Reference handling during refactoring

## Custom Extensions via Scripts

### Support for both Request and Response Mappings

### JavaScript & Groovy

### Support for all data-sources

### Additional features for SOAP and JDBC

## Admin-cockpit Enhancements

### Test Connection for defined destinations

### Usability improvements

- related to logout;
- session timeout consistency across all pages;
- sorting/filtering of Services
- sorting for Destinations
- consistent texts/labels/messages
- destination details page

## URL Enhancements

### Unification of the URLs between SMP Admin, IGW Cockpit and provisioned OData services

## OData Capabilities

### SOAP

- Navigation (two levels)

### JDBC

- \$Select
- \$Expand
- Navigation
- OrderBy
- \$Top
- \$Skip
- Count
- InlineCount

### Custom processor (scripting) allows additional capabilities.

- Actual scenarios are currently being determined & documented

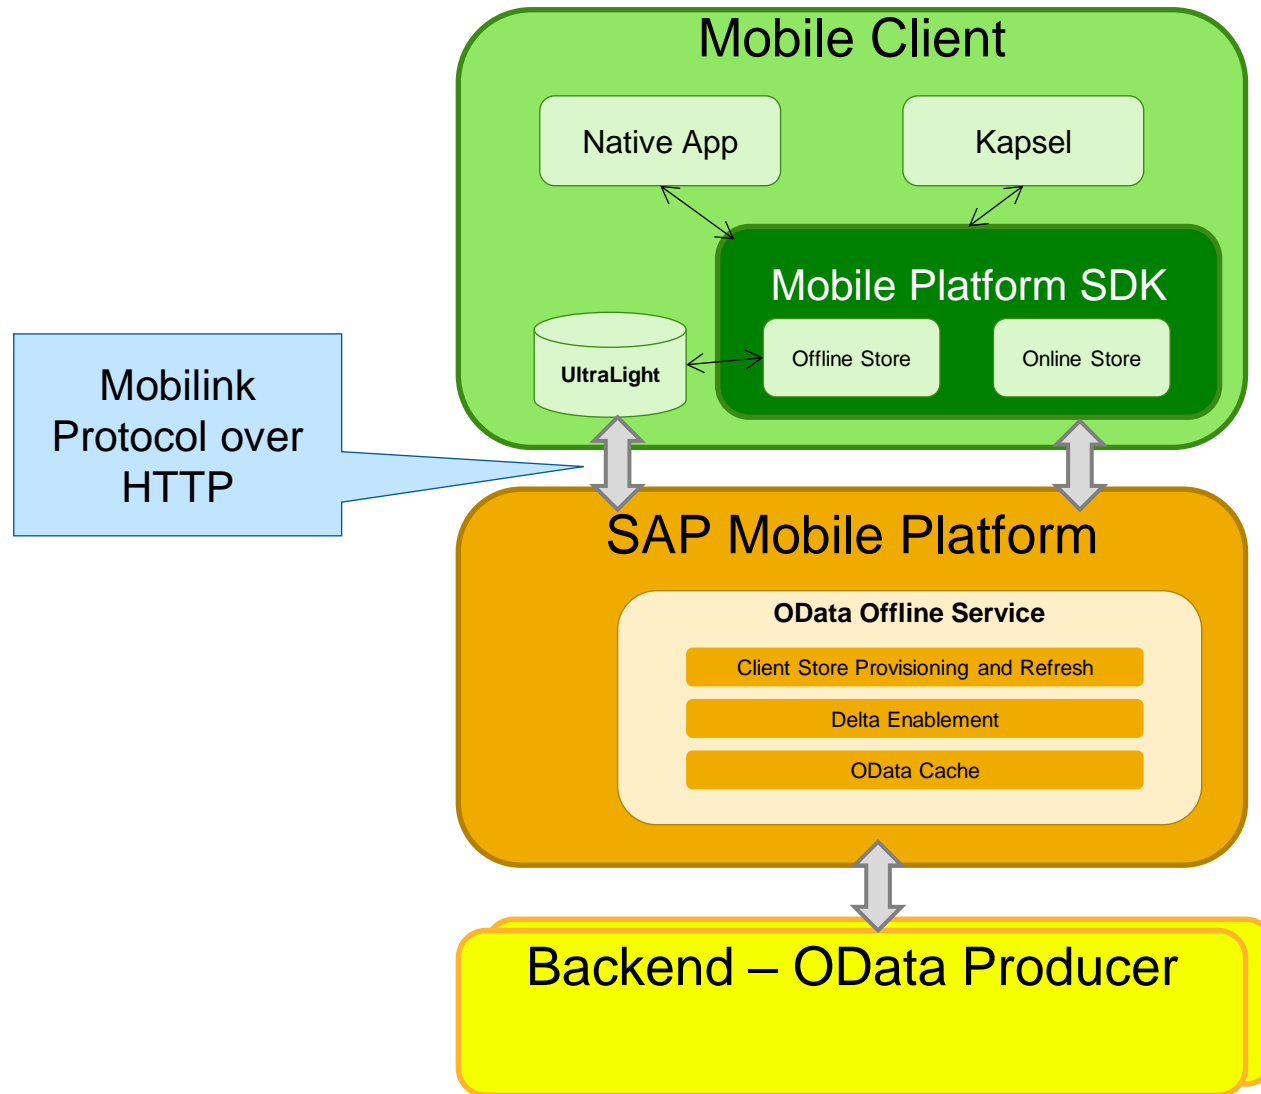

# Implementing Delta Query Support in SAP Gateway OData Services

# Agenda

---

- Offline Odata & SMP
- Delta tracking capabilities of SAP Mobile Platform
- Concept of delta querying
- Delta query support in Gateway OData services
- Implementation techniques
- Implementing delta query support with Mobile Add-On for SAP
- Example of delta query support implementation

# Offline OData and SMP 3.0 SP4

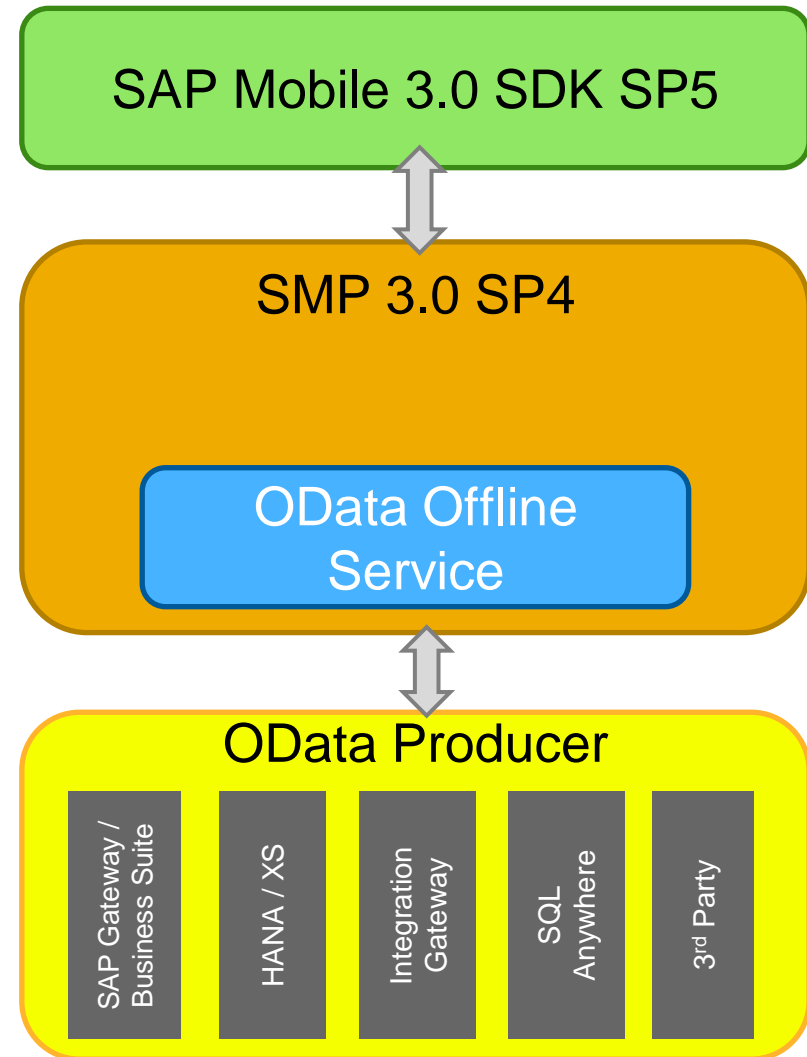

# OData Offline Service

## Benefits

- Always-available applications, OData everywhere, harmonized online/offline API, integration with SMP services (authentication, supportability, manageability).

## Features

- Take remote OData services and run them locally on device
- UltraLite as client database (iOS, Android)
- Optimized for OData services supporting v4 Delta Query
- Middle-tier delta enablement for all other OData services
- Middle-tier caching of generic OData collections

# Initial Download Sequence

Mobile App

Optimized Offline  
OData Transport

OData  
Producer

# Request for Refresh Sequence

---

Mobile App

Optimized Offline  
OData Transport

OData  
Producer

# Delta tracking capabilities of SAP Mobile Platform

---

## Delta tracking in SMP 3.0

- Responsibility completely delegated to backend system
  - Change Tracking by backend system
  - Change Logging in backend system
- Netweaver Gateway provides the interface and functionality via delta query support for OData services
  - Mimics delta tracking by allowing the client to fetch only new, changed and deleted records since the last time the same query was executed.

# Concept of delta querying

---

- Delta querying basically means “give me all entities that were created, changed or deleted since I last asked”
- Defines a pull-model protocol for clients to obtain changes in an entity set.
- Useful for projects where performance is critical and loading the full payload each time is not acceptable

# Concept of delta querying

---

- The backend system logs all creations, changes and deletions of delta enabled data sets in the delta log
- When the client requests a data set, the server issues a delta token with a time stamp which is returned to the client along with the requested data set
- The next time the client requests the same data set, it returns the delta token to the server
- The server compares the time stamp on the delta token to the time stamps of the records in the change log
- Only records that are new, changed or deleted since the delta token was issued are returned to the client

# Delta query support in Gateway OData services

---

- SAP NetWeaver Gateway, starting from version 2.0 SP07, provides delta query support for hosted OData services
- Methods `GET_ENTITYSET` and `GET_ENTITYSET_DELTA` are used to manage delta handling
- When the client requests the entity set the first time, the `GET_ENTITYSET` method will be called and will return the entire collection along with a delta token
  - The delta token is normally a date time stamp combined with a GUID
- When the client requests the entity set again and includes the delta token in the request, the `GET_ENTITYSET_DELTA` method will be called and will return the delta collection along with a fresh delta token

# GET\_ENTITYSET and GET\_ENTITYSET\_DELTA methods

---

## GET\_ENTITYSET method

- Returns complete entity collection, unless filters are applied
- Implementation to generate and return delta token must be added by developer

## GET\_ENTITYSET\_DELTA method

- Called when the client provides a delta token in the request
- Returns only entities that are new, changed or deleted since the last time the method was invoked by the client
- Implementation to handle delta calculation must be added by developer

# Implementation techniques for delta detection

---

Two approaches to consider:

- Using ABAP based delta request log
- Using Mobile Add-On for SAP

# Using ABAP based delta request log

---

- Hash values are calculated and stored for each entity in the collection
- On a delta request, a hash value is calculated again for each entity and compared for changes from the prior call
- Advantage: Smaller implementation effort while providing sufficient delta functionality
- Disadvantage: Delta determination at request time and potential negative performance impact on the backend, especially for large collections

# Using Mobile Add-On for SAP

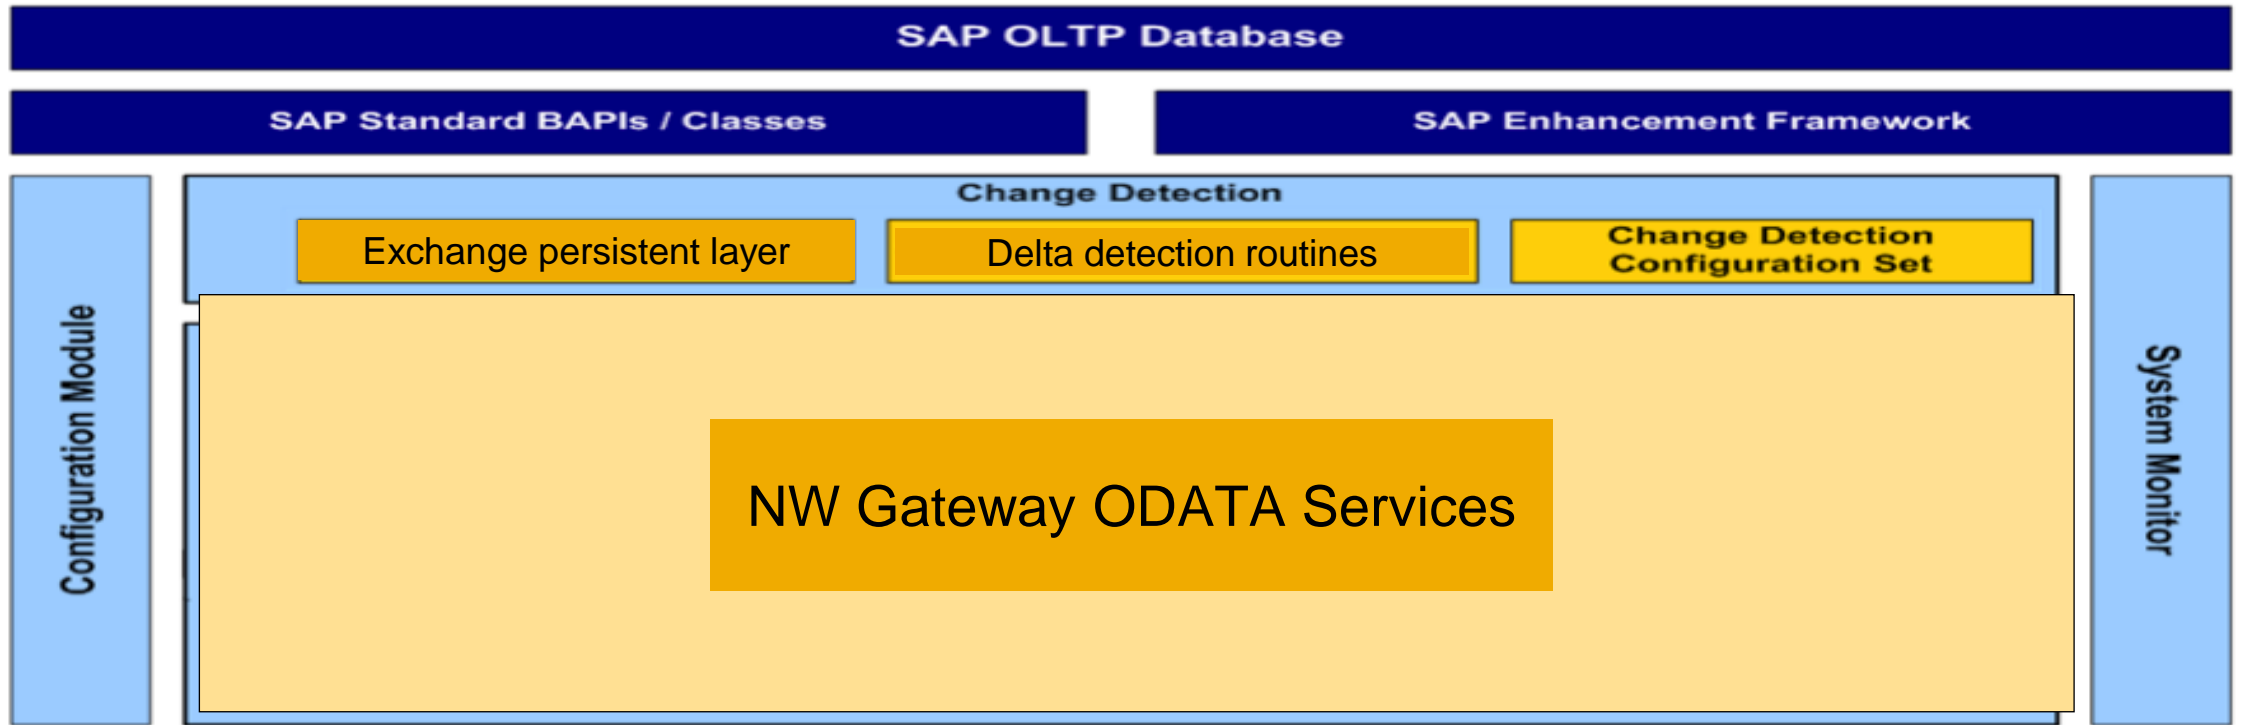

---

- Exchange Framework is part of the Mobile Add-On for SAP
- Provides an advanced framework for detecting and storing changes for SAP business objects
- Exchange tables are used store information on the records that have been created, updated or deleted.
- Helper class provided by framework can be used by Gateway to access exchange tables to enable delta queries
- Advantage: Delta determination at modification time as they occur, more scalable, and more optimized performance
- Disadvantage: Requires more development

- Legend
- Syclo Integration Framework
  - Syclo Application Objects
  - SAP Objects

# Mobile Add-On for SAP Add-on Architecture

# Mobile Add-On for SAP installation

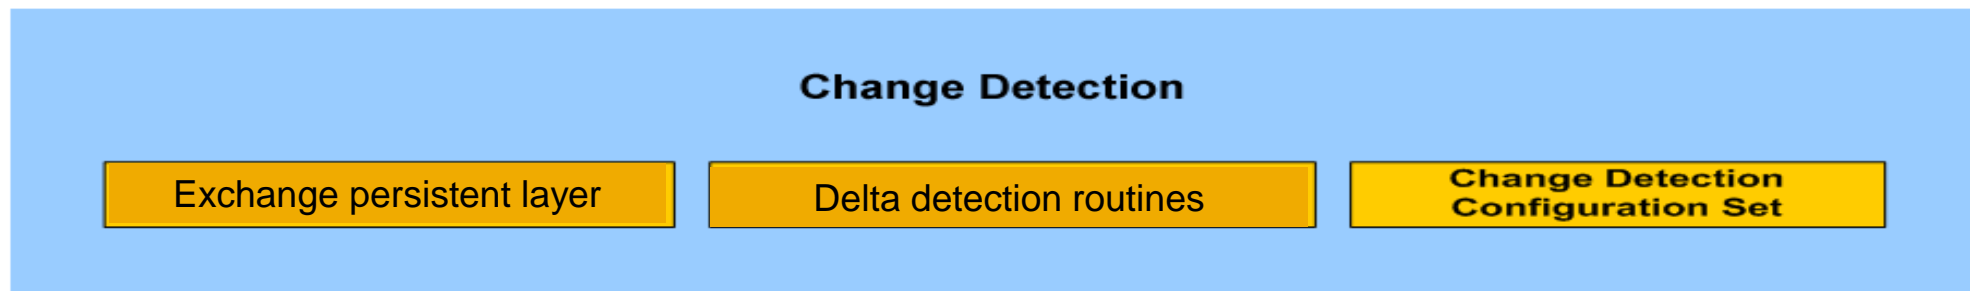

---

- Add-On is installed in the SAP ABAP Backend
- Download from Service Marketplace
  - Software Downloads -> Installation and Download Catalog -> Browse our Download Catalog -> SAP Mobile Solutions -> Mobile Add-On for SAP
  - Unpack using `sapcar -xvf <filename>.sar`
- Installation
  - install in backend using Transaction SAINT in client 000
  - Requires a certain level patch level for SAP\_ABA, SAP\_BASIS
  - Installation time
    - ½ day to 1 day

# Change Detection Layer

---

- **Detect and Track Changes to the (Relevant)Objects in the backend**
- **Consists of the following elements**
  - Change Detection Configuration Set
  - Delta Detection Routines
  - Mobile Exchange Persistent Layer

# Change Detection Layer – Delta Detection Routines

- **EFI Triggers + Business Logic to detect if a Object data was modified in the Backend**
- **EFI Trigger is provided by Enhancement Framework Implementation**
- **The Business Logic in this Layer determines whether the Change is relevant to the Mobile Application**
  - If Relevant, updates Exchange Tables (Persistent Layer)

Relevant

Not Relevant

Add to Exchange Table, Key + TimeStamp + Action

Discard

Action -  
Insert,  
Update,  
Delete

# Finding correct spot for EFI Trigger

---

- BAdI Builder : Transaction SE18 / SE19
- Transaction SMOD / CMOD ( customer exits )
- Enhancement builder tool
  - Integrated in ABAP Workbench ( SE80)
  - Select development object -> Main menu -> Enhance Source Code
  - Edit -> Enhancement operations
  - Can enhance any Function module, ABAP programs , methods, etc
- Must be part of the LUW of the transaction

# Change Detection Layer – Persistent Layer

- **Contains Tables that Store changes to relevant Objects**
  - Stores Unique Key of the Object, Time of Last Modification,
- **Information stored is later used for Delta queries**

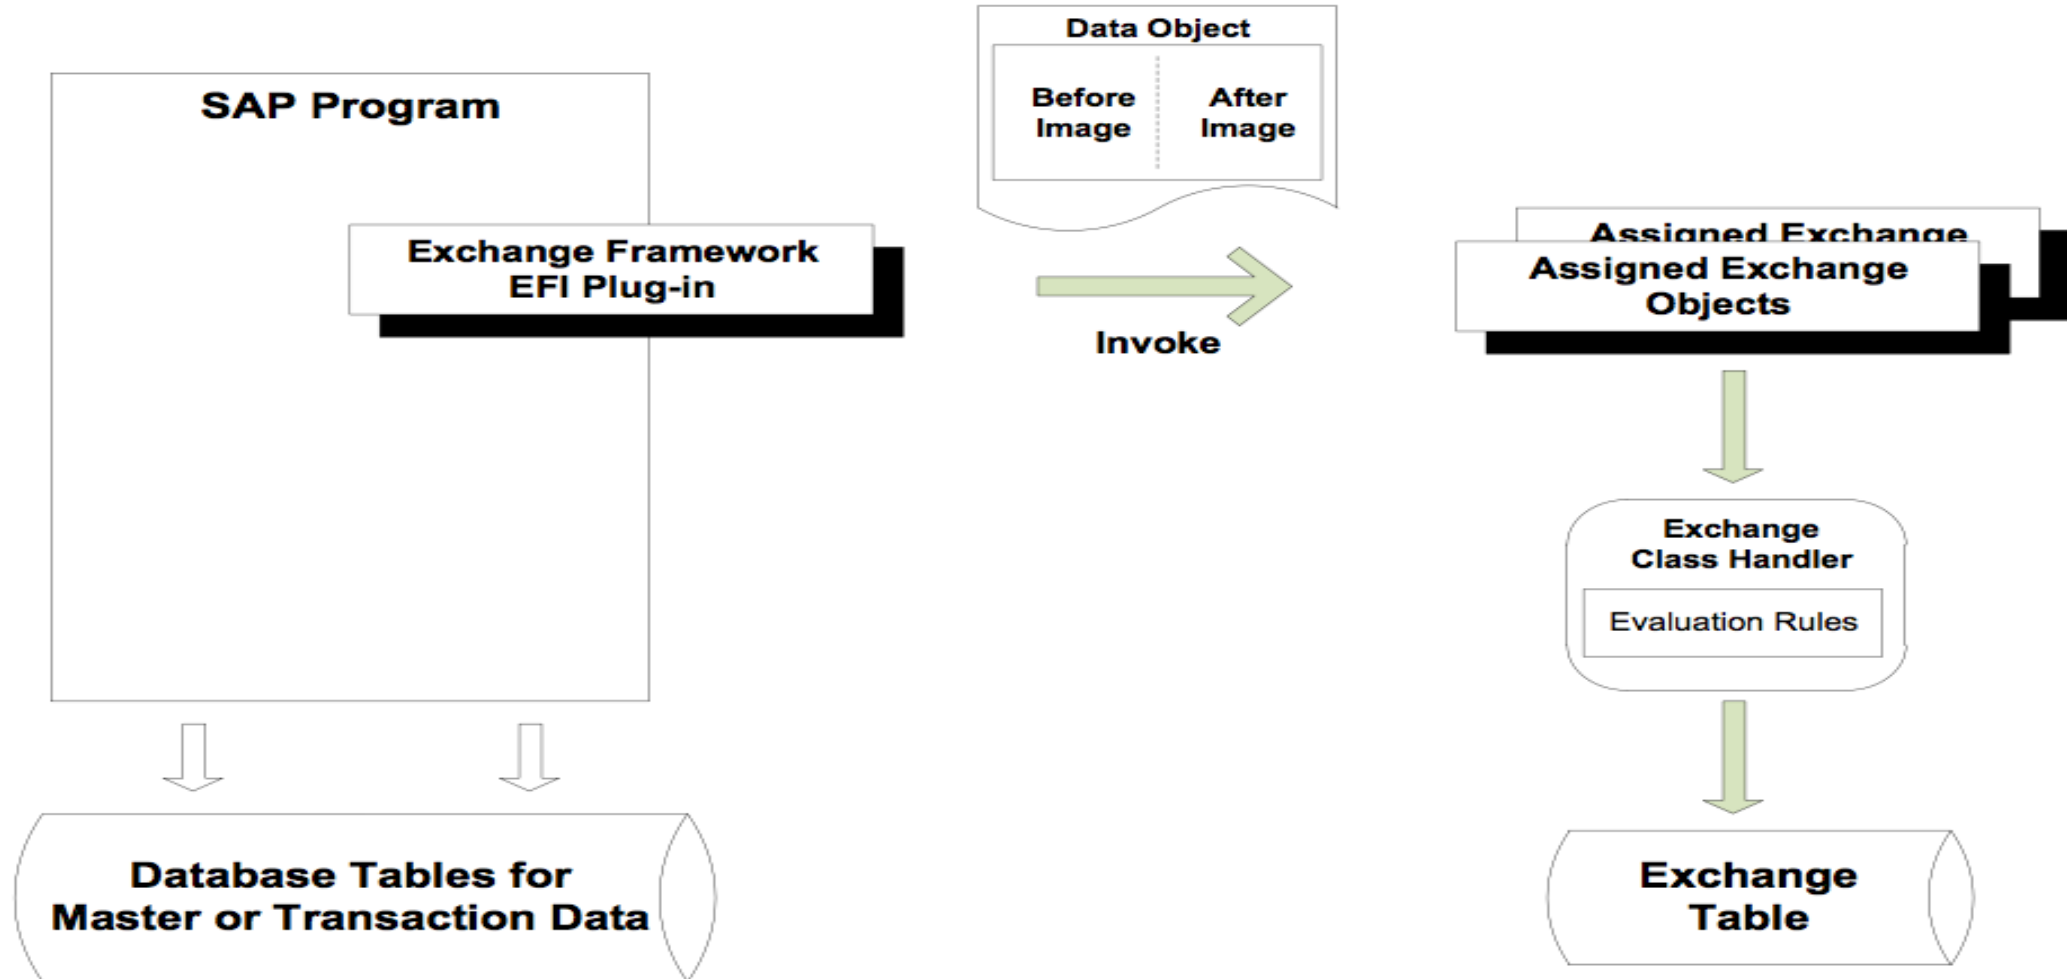

# Change Detection Layer – Configuration Set

---

- **Configuration that defines the following (in Config panel)**
  - Define Exchange Object (an Object that needs to be Monitored) and map it to the Handler class
  - What are the relevant Fields of Object to be Monitored
  - Specify Exchange table to store Changes for the Object
  - Filter settings to further filter out at field level based on a criteria (Eg: Change is relevant only if the change in the Plant Field = “New York”)
  - EFI Assignment (Enhancement Framework Implementation) – Notify the change to a specific Exchange Object
- **Accessed via “Backend Change Detection Settings” in Config Panel**
  - Exchange Object Configuration
  - EFI Assignment

# Delta detection

# Delta query support implementation for ODATA

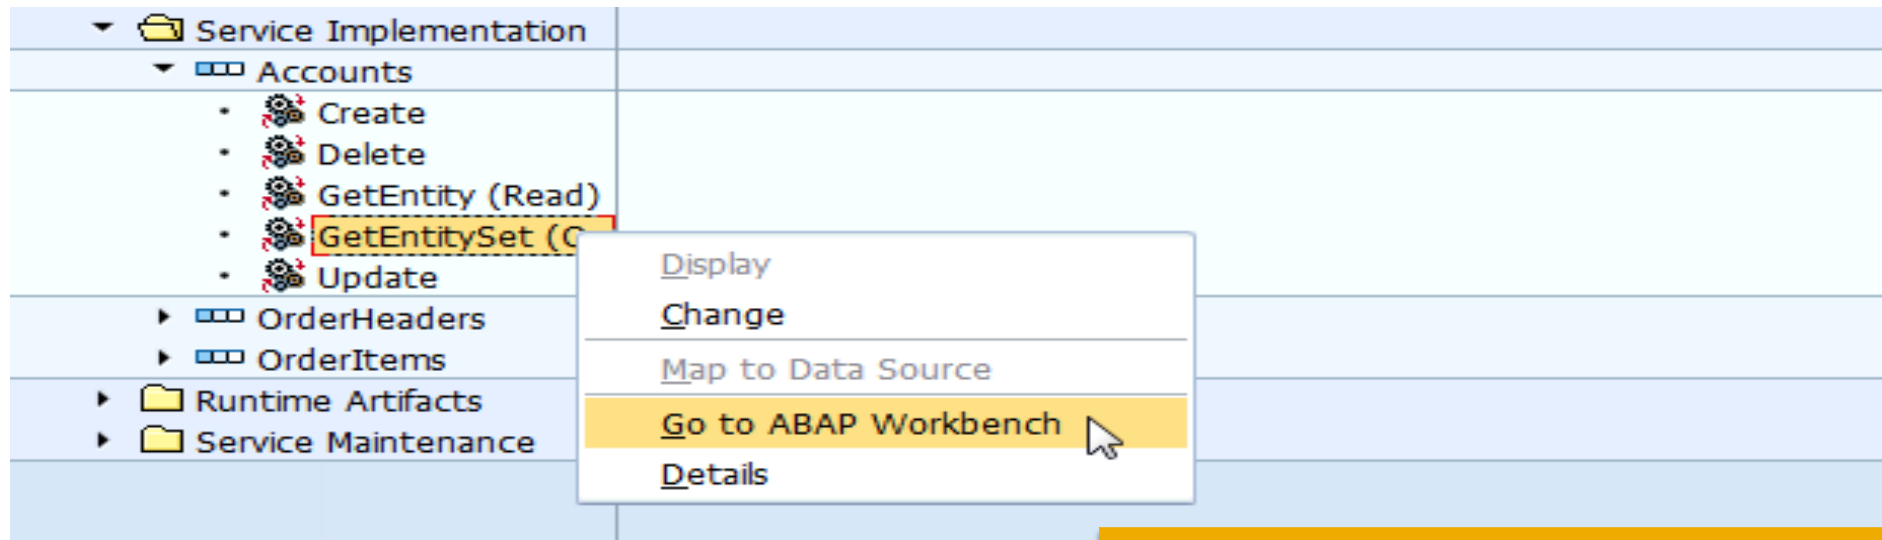

---

- Enhance Odata service
- Provide delta query support for entity set
- Using implementation technique with Exchange tables

# Enhance Runtime Data Provider Class for Account

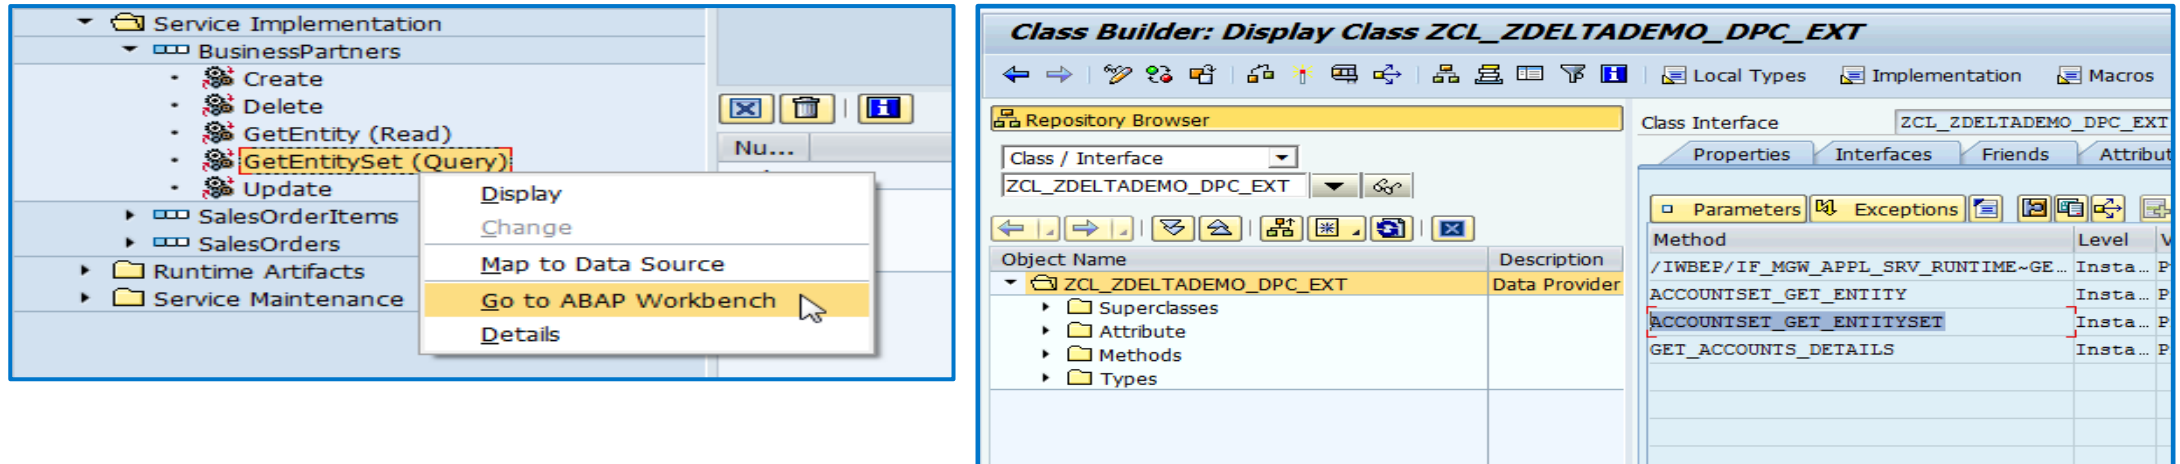

Using SE80 or Gateway Service Builder perform the following tasks:

- Enhance method GET\_ENTITYSET
- Redefine method GET\_ENTITYSET\_DELTA

Operation	ABAP Method
Query	<Entity>_GET_ENTITYSET
Delta Query	<Entity>_GET_ENTITYSET_DELTA

# Enhancing GET\_ENTITYSET method

```
method ACCOUNTSET_GET_ENTITYSET.
```

```
< get all accounts assigned to this user >
```

```
CALL FUNCTION 'ZDD_GET_ACCOUNTS_IDS_FOR_USER'
```

```
CALL FUNCTION 'ZDD_GET_ACCOUNTS_DETAILS'
```

```
endmethod.
```

# Enhancing GET\_ENTITYSET method

## ➤ Code enhancement 1: Add delta token to the response

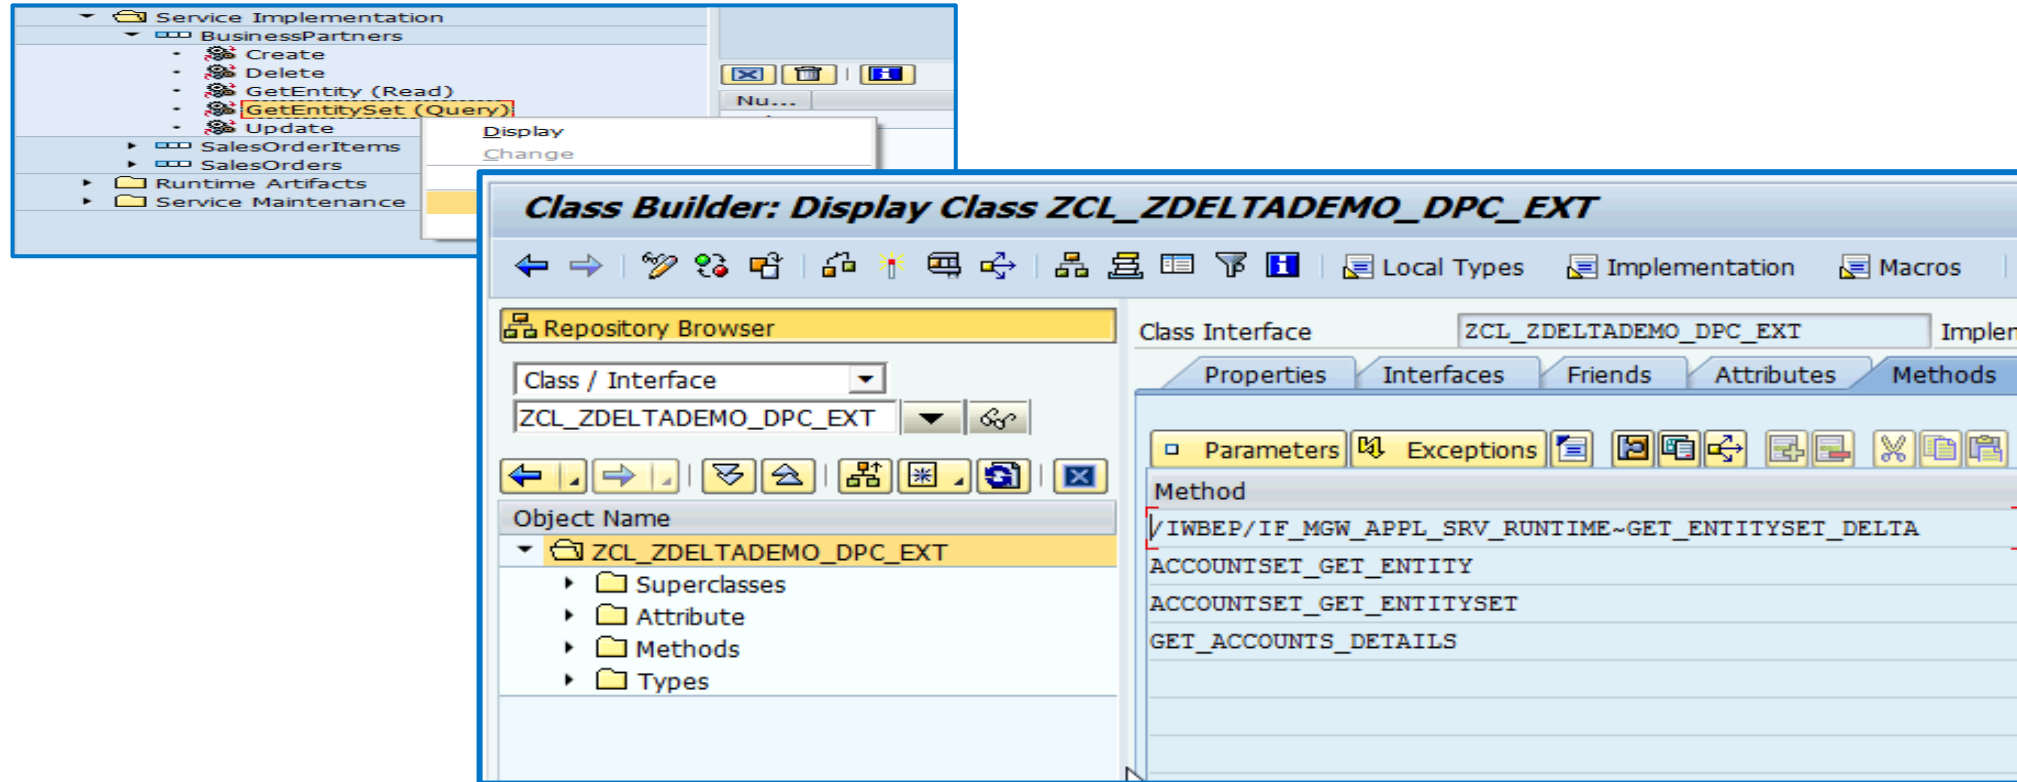

```
* generate the delta token
  /syclo/cl_core_bapi_tools=>get_system_time ( IMPORTING ev_sys_datum = lv_date
                                              ev_sys_uzeit = lv_time ).

CONCATENATE lv_date lv_time INTO es_response_context-deltatoken.

* add to header of response
  ls_header-name   = 'deltatoken'.
  ls_header-value  = es_response_context-deltatoken.

CALL METHOD me->/iwbep/if_mgw_conv_srv_runtime~set_header
  EXPORTING  is_header = ls_header.
```

# Redefining GET\_ENTITYSET\_DELTA method

# Redefining GET\_ENTITYSET\_DELTA method

- **Code enhancement** : Determine changed objects and merge with objects that the user is allowed to see

```
* Get delta token from the odata call
lv_delta_context ?= io_tech_request_context.
lv_delta_token = lv_delta_context->get_deltatoken( ).

• Get exchange table contents for delta token ( see note 1921547 )
CALL METHOD /smfnd/cl_core_exobj_tools=>determine_delta_objkeys EXPORTING
    iv_mobile_app          = <your mobile app>
    iv_exchobj             = <exchange object>
    iv_time_token          = lv_delta_token
    iv_time_zone           = 'UTC'
IMPORTING
    eref_exch_data         = lr_ref_exch_data

ASSIGN lr_ref_exch_data->* TO <lt_delta_tab>.

• Inspect exchange table data. * Get account details

* Handle deleted case ( action = 'D' ). Add entries to ER_DELETED_ENTITYSET.
* Handle insert/update ( action = 'I' or 'U' ). Add entries to ER_ENTITYSET
```

# Enhancing GET\_ENTITYSET\_DELTA method

- **Code enhancement** : Add delta token to the response

```
* generate the delta token
/syclo/cl_core_bapi_tools=>get_system_time ( IMPORTING ev_sys_datum = lv_date
                                             ev_sys_uzeit = lv_time ).

CONCATENATE lv_date lv_time INTO es_response_context-deltatoken.

* add to header of response
ls_header-name   = 'deltatoken'.
ls_header-value  = es_response_context-deltatoken.

CALL METHOD me->/iwbep/if_mgw_conv_srv_runtime~set_header
EXPORTING  is_header = ls_header.
```

# More information

# Push Enablement in SAP Mobile Platform 3.0

# Steps to Enable Push Notifications

---

## Steps to sending push notifications:

- **Configure Application Push Settings in SMP**
- **Get and Store User's notification token on their SMP registration**
- **Subscribe to OData notification**
- **Trigger the Notification from the backend**
  - Implement BADI at proper location to trigger push

# Configure Push Notification Settings on SMP

## Configure push notifications for:

- iOS
- Android
- BlackBerry
- Windows 8, Windows Phone

### Apple

APNS endpoint  None  
 Sandbox  
 Production

Certificate \*

Password \*

### Android

Application key

Sender ID

### Blackberry

Push type  None  
 BES  
 BIS

### Windows

Push type  None  
 WNS

Package SID \*

Client Secret \*

# Store User's Device Notification Token on SMP

**The User's Notification Token must be stored on the SMP server.**

- REST API to store on User's registration data
- Native SDK wrapper for REST API

Save Notification Token

# Subscribe to OData Notification

## Tell the Gateway Server that you want to be notified.

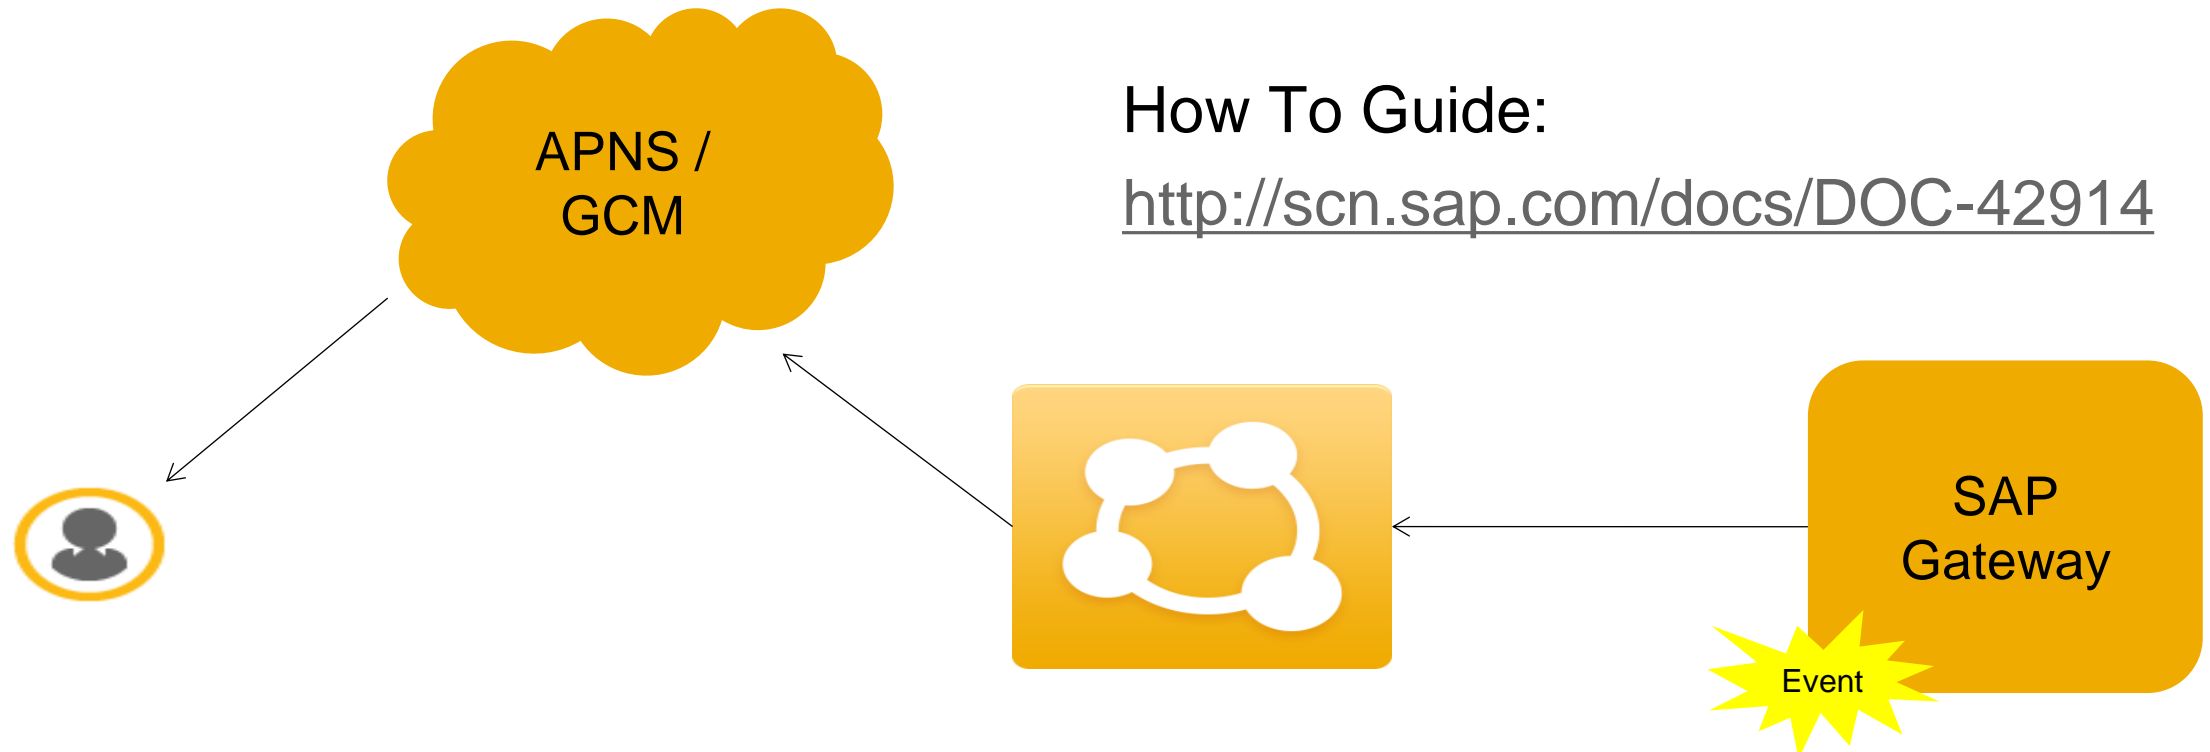

- Option on all OData services
- Send Call-Back URL that is used by backend to inform you of the notification

# Trigger Notification

## Trigger Notification at proper spot based on business criteria.

- When event is triggered in backend call SAP Gateway class for sending notifications
- SAP Gateway will call the call-back URL specified when user subscribed.
- SMP in turn sends the notification to the appropriate device notification service.

# Enhanced Push Services – SMP SP4

---

## Introducing new PUSH APIs:

- **PUSH Notification to a device via registration ID**
- **PUSH Notification to devices registered of an application**
- **PUSH Notification to devices registered to all devices/registrations of a user**
- **PUSH Notification to a list of user of an application**
- **PUSH Notification to a list of registrations**

# Push Example:

## PUSH Notification to a list of user of an application

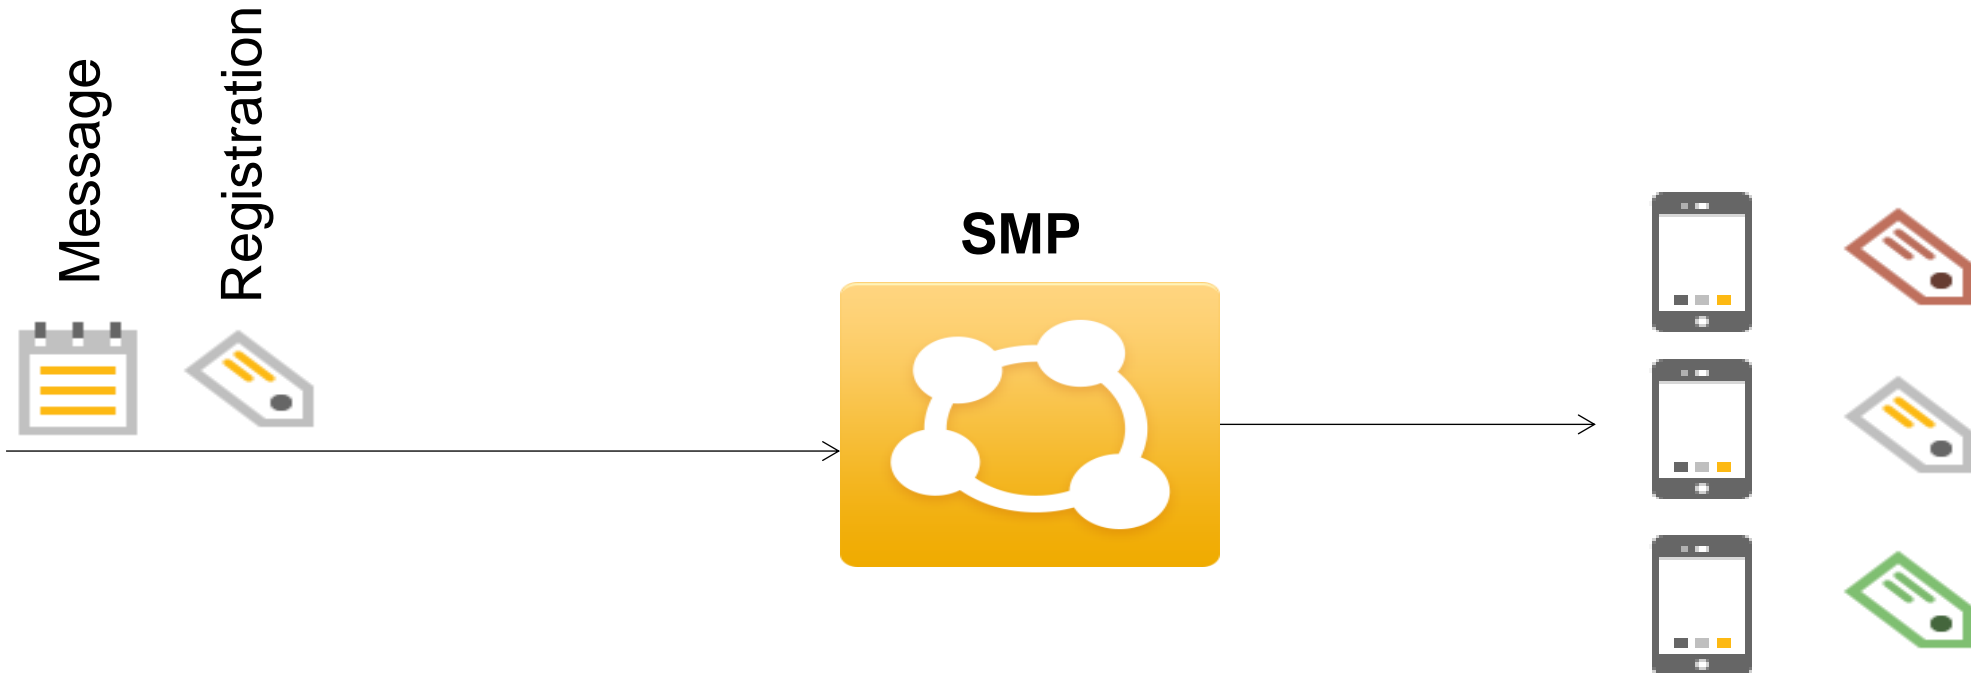

### Application

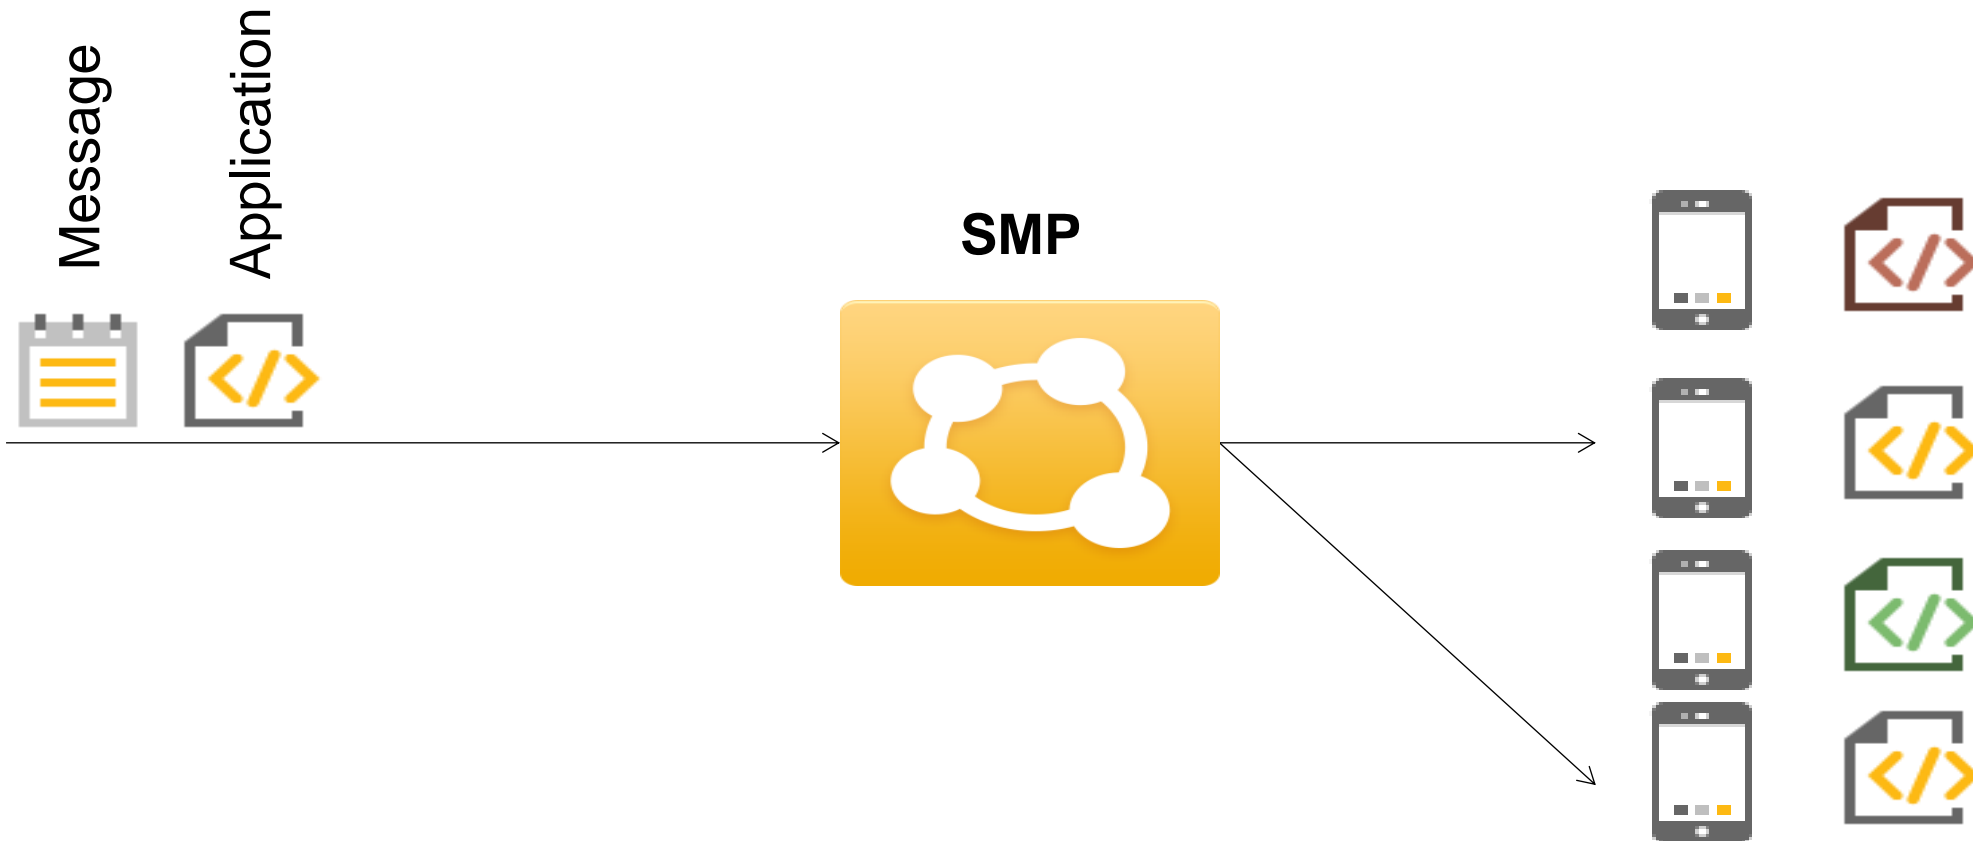

# PUSH Notification to a device via registration ID

POST `http(s)://server:port/restnotification/registration/{applicationRegistrationId}`

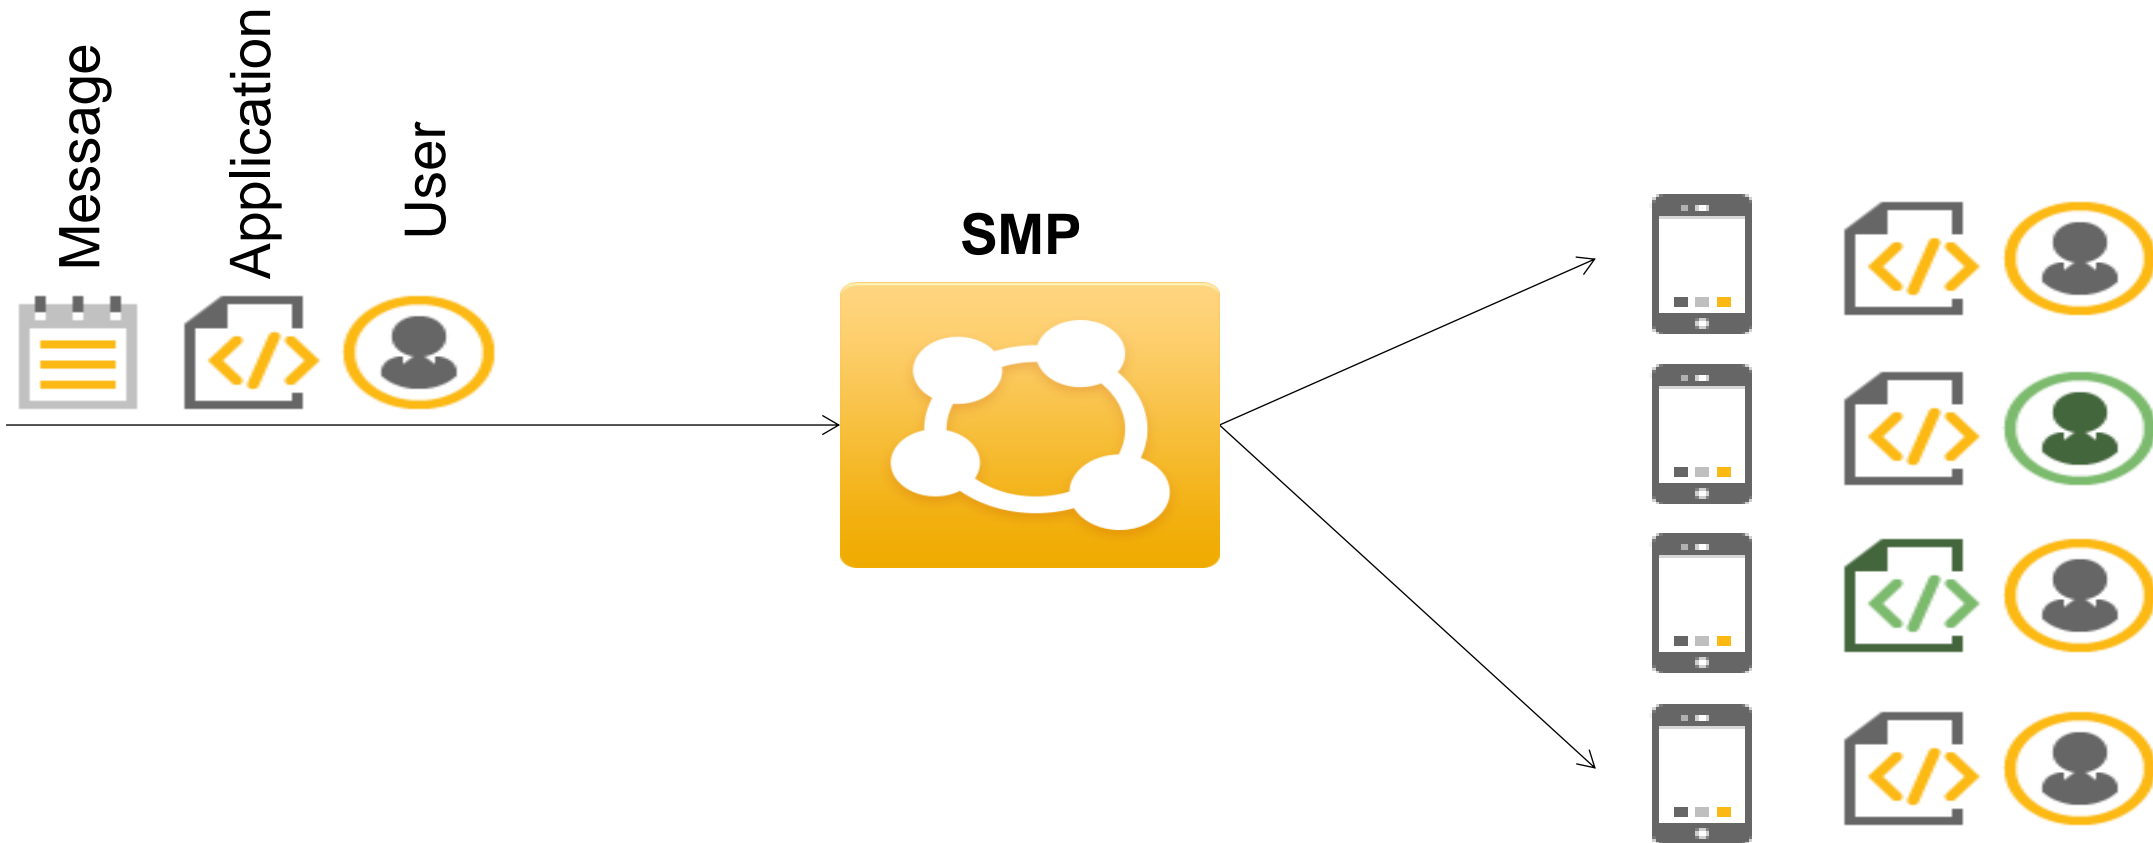

# PUSH Notification to devices registered of an application

POST `http(s)://server:port/restnotification/application/{applicationId}`

# PUSH Notification to devices registered to all devices/registrations of a user

POST `http(s)://server:port/restnotification/application/{applicationId}/user/{userId}`

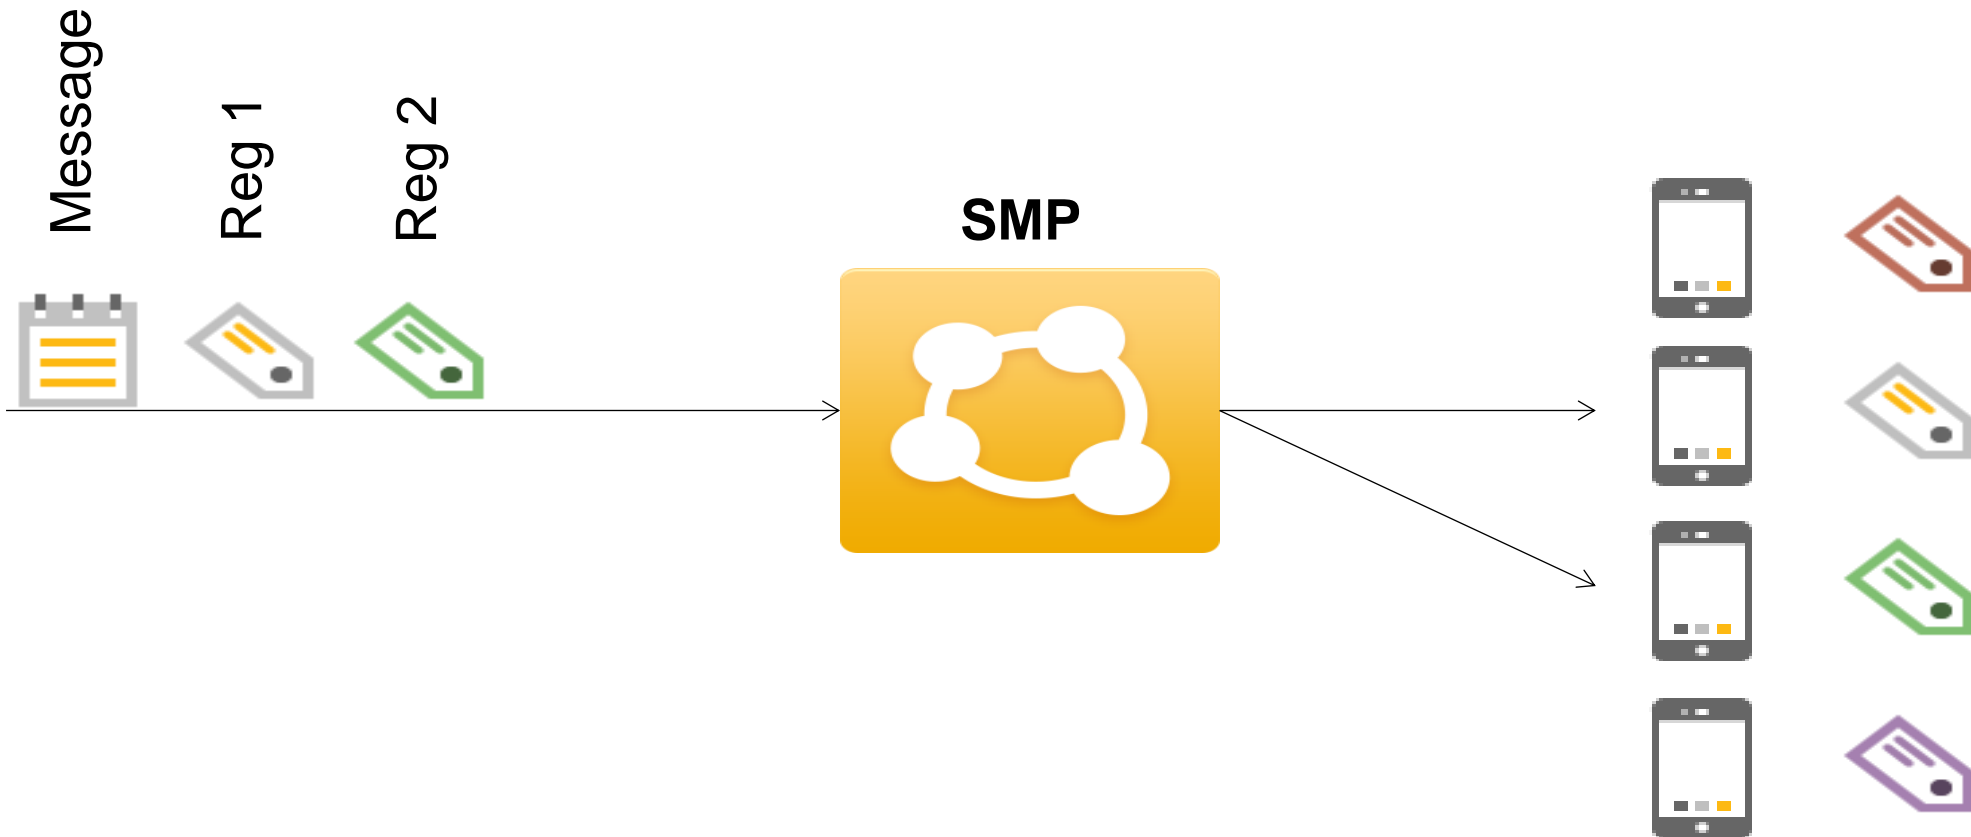

# PUSH Notification to a list of user of an application

POST `http(s)://server:port/restnotification/application/{applicationId}/user`

# PUSH Notification to a list of registrations

POST [http\(s\)://server:port/restnotification/registration](http(s)://server:port/restnotification/registration)

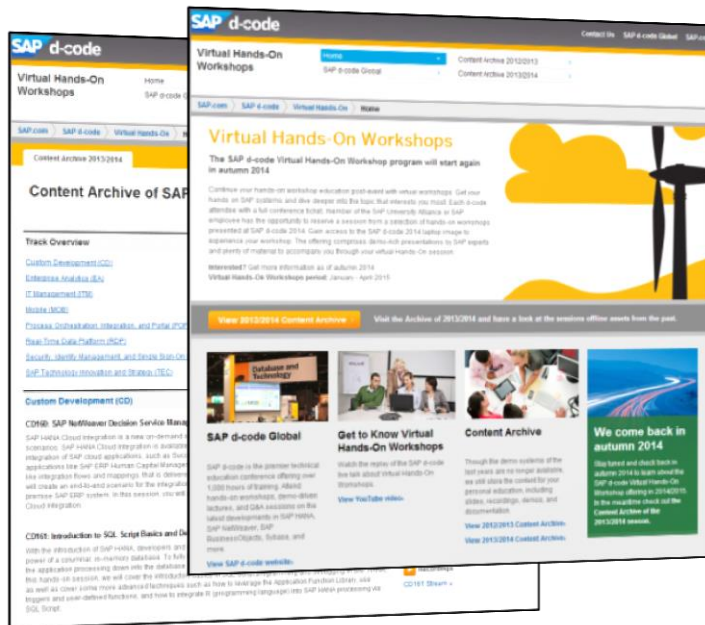

# SAP d-code Virtual Hands-on Workshops and SAP d-code Online

## Continue your SAP d-code education after the event!

### SAP d-code Virtual Hands-on Workshops

- Access hands-on workshops post-event
- Starting January 2015
- Complementary with your SAP d-code registration
